Y.f The sustaining power of a pile driven home, the resistance which it meets with, and the force of the blow, are, of course, equal. The subsequent settlement of the material around the pile, however, increases its supporting power, and this varies in different kinds of soil. This increased support cannot, however, be relied upon if there is any vibration in the piles, or if there is a scour about them. In foundations under water there will be a degree of fluidity given to the material by the operation of driving, which lessens the frictional resistance to the penetration of the pile, but the superior gravity of sand to that of water allows it to settle in close contact with the pile, and gives a greater coefficient of support, than if it was driven through the same kind of material in a dry state. There is no increased force of blow obtained by a fall of more than 40 feet, as the friction on the ways increases so rapidly that no increased velocity is attained by falling from a greater height. Thirty feet is the most useful fall, as the machines are commonly made. The steam hammer of Mr. Nasmyth has been very successfully applied to the driving of wooden piles. In this engine, a great number of very rapid blows from a very heavy ram produces an excellent result. The pile is not allowed to recover from one blow before...
